

**Impero EdAdmin** is our powerful and scalable cloud-based network management module for managing devices across schools and districts. It boasts a detailed visual dashboard, providing device detail and activity in a single view. **Impero EdAdmin** provides an intuitive search bar within a web-based interface and offers the most valuable tools that technical teams need to support the digital learning environment on a day-to-day basis.

## The key features

### Remote control

Providing technical teams with remote access to devices (across multiple schools sites) to identify and resolve issues, so resources remain functional and up-to-date, minimizing disruption for teachers and students alike.

### Device inventory

Tracking the status and details of all devices on the network, including hardware information, its location and a summary of its users.

### Tech tools

Enabling admin staff to remotely perform a series of technical tasks on one or multiple devices, with escalated privileges, and without the need to log the users out e.g. lock screen and disable internet.

### Multi-site management

Supporting multi-site establishments with the ability to oversee devices across multiple school networks (across disparate locations) and highlighting utilization at an individual or group level with secure permissions-based access for all users.

### Utilization reporting

Compiling key device data, including information that could signify an impact on teaching and learning, as well as under-utilized technology (which could be better used elsewhere on campus), empowers technical teams to proactively manage devices.

### Real-time monitoring

Monitoring all or multiple devices on the network, with a list or thumbnail view to identify misuse or inappropriate behavior and to observe technical issues as they occur.

### Four eyes authorization

Providing an additional layer of authorization for Impero's security and privacy settings ensures critical permission changes are validated by school administrators.

### Web-based interface

Simplifying the management and monitoring of devices across a network by enabling day-to-day tasks to be executed from an intuitive, web-based interface.

### Geolocation management

Notifying when a device enters or leaves the geofence of the school to help quickly locate it and identify the current user.

# The key benefits

## Save time

Removing the need to physically perform device or network maintenance by remotely managing these tasks. This helps to support staff and students on a daily basis and reduces the impact on teaching and learning.

## Ensure appropriate privacy

Helping to ensure the privacy of a school's sensitive data using four-eyes authorization, which requires two individuals to approve any actions or changes and ensures appropriate and auditable privacy governance.

## Improve efficiency

Taking a proactive approach to reducing any technological barriers to teaching and learning helps technical teams ensure their users can focus on their core task of teaching, rather than dealing with technical issues and its disruption on learning.

## Identify root causes

Remotely identifying the root causes of some device or network issues, such as a device running low on storage space or requiring a new software version (all within a central view), reduces manual processes and saves time for technical teams.

## Enhance digital learning

Remote control features ensure equipment is functioning correctly across individual or multiple school sites, reducing disruptive downtime for staff and students alike and contributing to a better digital learning environment.

## Enable transparency

The ability to remotely view all devices in a single view, and drill down into the details of each device, provides technical teams with a complete, transparent view of the whole network.

## impero education pro

### As part of Impero Education Pro

**Impero EdAdmin** can be purchased standalone or as part of the suite, for a more comprehensive approach to device monitoring and management. Deployed as part of **Impero Education Pro**, **Impero EdAdmin** fully integrates with **Impero EdTeach** and **Impero EdProtect** so that classroom control and student online safety form an all-inclusive network administration strategy that can be managed centrally.

## impero patch

### Customize with add-ons

**Impero Patch** uses automated detection to identify, download and deploy critical patches for a significant number of applications used by teachers and learners on a daily basis, ensuring proper preventive measures are taken against potential threats.
