impero
patch

Impero Patch is an add-on module available with **Impero EdAdmin** or as part of the **Impero Education Pro** suite. Designed to strengthen endpoint security and protect the top education software applications, **Impero Patch** uses automated detection to enable school technical teams to identify, download and deploy missing patches for Microsoft and more than 60 third party applications (including Flash and Java). The ability to schedule automated updates prevents the exposure of vulnerabilities to the network, reduces potential downtime and saves time.

The key features

Automated patching

Scheduling patching for specific devices using a variety of criteria (including time and date), by using active directory, or by manual group creation.

Wake-on-LAN

Setting wake-on-LAN scheduled patching to power on devices, apply patches, and then shut down machines once complete.

Update scheduling

Configuring installation schedules to determine which products will be patched by the system and when updates will be applied.

Easy-to-create policies

Creating customized policies for automated patching to ensure systems are kept updated and protected, while saving time for technical teams.

Interactive dashboards

Providing a centralized overview of the network's current patching state, with access to key information such as the most popular missing patches grouped by severity.

Detailed reports

Generating reports prior, during, and after the patching process – and by date, time, machine, details or log type – to reveal events or errors and to prove endpoint security.

The key benefits

Save time

Automate the scanning and scheduling of missing patches, and easily create policies, removing the hassle of manual processes and reducing admin workload.

Reduce downtime

Reduce disruptive downtime for teachers and learners by scheduling automated patching overnight or during non-peak times and by ensuring network devices are kept protected and up-to-date.

Improve efficiency

Schedule automatic updates to keep systems updated, improving working processes and helping to streamline networks.

Ensure accuracy

Automatically scan the network for outdated or vulnerable software to avoid the risk of overlooking update notifications or patching incorrect versions.

Strengthen security

Maximize endpoint security to keep systems updated, significantly reduce vulnerabilities and the risks of viruses.

Minimize risk

Reduce exposure to vulnerabilities through the wake-on-LAN service, which can be used to automatically power-on devices, apply patches, and shut down once patching is complete.
